

AI-Skills

A personal library of skills, standards, and tool guides for AI coding agents.
Write a rule once — every agent in every project benefits.

What's in here

Path	What it is
AGENTS.md	Universal agent instructions (behavior, quality, output style)
standards/	Coding and git conventions — each file is a registerable skill
tools/	Usage guides for specific tools (e.g. ticket/tk)
skills/	Claude Code SKILL.md format for reusable slash commands
supplements/	Personal notes, cert prep, reference docs
adapters/claude/	Claude-specific @-import adapter
skills.sh	CLI to list, add, and remove skills per project
CATALOG.md	Static snapshot of all available skills

Agent Setup (one-time, per machine)

Claude Code

Add to ~/.claude/CLAUDE.md:

```
@~/Developer/AI-Skills/adapters/claude/CLAUDE.md
```

[x] Already done on this machine.

Codex CLI

Add to ~/.codex/AGENTS.md:

```
@/Users/<you>/Developer/AI-Skills/AGENTS.md
```

[x] Already done on this machine.

Pi

Add to ~/.pi/agent/AGENTS.md (create if missing):

```
@~/Developer/AI-Skills/AGENTS.md
```

Or symlink: `ln -s ~/Developer/AI-Skills/AGENTS.md ~/.pi/agent/AGENTS.md`

Cursor

Create `.cursor/rules/ai-skills.mdc` in your project:

```
@~/Developer/AI-Skills/AGENTS.md
```

Other agents (Aider, Continue, Windsurf, etc.)

Point their system prompt or rules config at `AGENTS.md` or the relevant skill file.
See each tool's docs for the exact config path.

Per-project skill setup

1. See what's available

```
~/Developer/AI-Skills/skills.sh list
```

2. Register skills into a project

Run from inside the project, or pass the path

```
~/Developer/AI-Skills/skills.sh add ticket
```

```
~/Developer/AI-Skills/skills.sh add git
```

```
~/Developer/AI-Skills/skills.sh add general
```

Or with explicit path:

```
~/Developer/AI-Skills/skills.sh add ticket ~/Developer/react-admin
```

add writes to: - **CLAUDE.md** — @-imports for Claude Code - **AGENTS.md** — managed skill block for Codex, Pi, and others

3. Check what's registered

```
~/Developer/AI-Skills/skills.sh status
```

4. Remove a skill

```
~/Developer/AI-Skills/skills.sh remove ticket
```

Adding a new skill

1. Create a `.md` file in `standards/` or `tools/` with YAML frontmatter:

name: your-skill

description: One-line description shown in skills.sh list

category: standards # or: tools

```
tags: [tag1, tag2]
```

```
---
```

```
# Your Skill Title
```

```
...content...
```

2. It immediately appears in `skills.sh list` — no registration needed.

3. Update CATALOG.md:

```
cd ~/Developer/AI-Skills
```

```
{ echo "# AI-Skills Catalog"; echo ""; echo "> Auto-generated snapshot. Run \`skills.sh list
```
